

ThirstTrap privacy policy

LAST UPDATED 9 OCTOBER 2026

ThirstTrap is a plant-care diary for Android, written and published by Dheirav Prakash as an individual rather than a company. This page says what the app does with your information. It is short because the app does very little with it.

THE SHORT VERSION

There is no account, no server of mine, and no analytics. Your plants, your diary entries, your weights, your reminders and your photos stay on your phone. I cannot see any of it, and neither can anyone else, because none of it is sent anywhere.

One feature is an exception and it is off until you turn it on. That is the whole policy. The rest of this page is the detail behind it.

WHAT STAYS ON YOUR PHONE

Everything you put into the app:

- The plants you add, with their names, species, pot sizes, locations and notes
- Every diary entry: waterings, checks, feeds, repottings, observations
- Every weight reading and everything derived from it, including the predictions
- Your reminder times
- Your photos

All of it lives in the app's own private storage on the device. Photos in particular are kept inside the app rather than in your gallery, which is deliberate: a plant

diary should not scatter dozens of near-identical pot photos through the camera roll you share with other people.

I have no copy of any of it. There is nothing for me to have a copy of.

THE ONE THING THAT LEAVES THE PHONE

The app can look up a plant you have named, to fill in care notes it does not already hold. **This is switched off by default.** You turn it on in Settings, under Network, and you can turn it off again at any time. Nothing happens automatically: a lookup only runs when you ask for one on a specific plant.

When you do ask, two services are contacted, in this order:

1. **GBIF**, the Global Biodiversity Information Facility, at api.gbif.org , to turn the name you typed into a recognised plant species. The name you typed is sent, along with a note that it should be matched against plants rather than animals or fungi.
2. **Wikipedia**, at en.wikipedia.org , to fetch a short summary for whichever species GBIF matched. The matched scientific name is sent.

What is sent is the plant name and nothing else. No identifier, no device information, nothing from your diary, no photos, no weights, no location. The app identifies itself to both services as “ThirstTrap/1.0 (offline plant diary)”.

As with any request your phone makes to any website, those two services can see the IP address the request came from, which usually indicates roughly where in the world you are. That is a property of how the internet works rather than something the app chooses to send, but you should know it happens. Each service handles what it receives under its own privacy policy, and neither of them is mine.

Everything else in the app, the predictions, the reminders, the bundled plant catalogue, your whole diary, works with no network connection at all and always will.

WHAT THE PERMISSIONS ARE FOR

PERMISSION	WHY
Camera	Taking a photo of a plant. The photo is saved in the app and nowhere else
Internet	Only the species lookup described above, and only when you ask for one
Network state	Checking whether you are online before attempting a lookup, so it can say "offline" instead of hanging
Notifications	Showing your reminders. Composed and shown on the device
Vibrate	A short buzz when you log something, so you know it registered

ANALYTICS, ADVERTISING AND TRACKING

There is no analytics library in the app, no crash reporting, no advertising, and no third-party tracking of any kind. Nothing about how you use the app is sent anywhere, to me or to anybody else.

The app does keep one record about its own use, and it stays on your phone. When you open a logging screen it notes that the screen was opened, whether you saved or backed out without saving, and whether you changed a figure it suggested. It records the action and never the content: no notes, no amounts, no weights, no photographs, nothing you typed.

It exists because the most useful thing to know about an app is what people give up on, and giving up leaves no trace in a diary by design. A watering log that quietly went unused for a fortnight is invisible unless something counts the times a screen was opened and closed again.

Those rows live in the same local database as everything else, go into your backup with the rest of it, and are deleted with the app. If you ever tell me something in the app is awkward, they are what would let me find out where, and only if you chose to send me a backup.

BACKUPS, AND WHAT THEY MEAN FOR YOUR PRIVACY

You can export everything to a single zip file from Settings. That file is yours, it goes wherever you tell your phone to put it, and the app does not upload it or keep a second copy. Once it leaves the app it is as private as the place you put it, so if you store it in a cloud drive, that drive's privacy terms apply to it and not this policy.

Worth knowing for a different reason: a backup does include your photos, so it is a complete copy rather than a partial one. But photos live only in the app's private storage otherwise, so uninstalling without exporting first destroys them, and an old export cannot return anything taken after it.

CHILDREN

The app is not directed at children and collects nothing from anybody, so there is nothing specific to say here beyond that.

DELETING YOUR DATA

Uninstall the app. Because nothing is stored anywhere else, uninstalling removes all of it, and there is no request to make of me and no account to close. If you want to keep any of it first, export a backup before you uninstall.

CHANGES TO THIS POLICY

If the app ever does something new with your information, this page changes first and the date at the top changes with it. If a change ever meant information

leaving your phone that does not leave it today, it would be off by default and ask you, the same way the species lookup does.
